

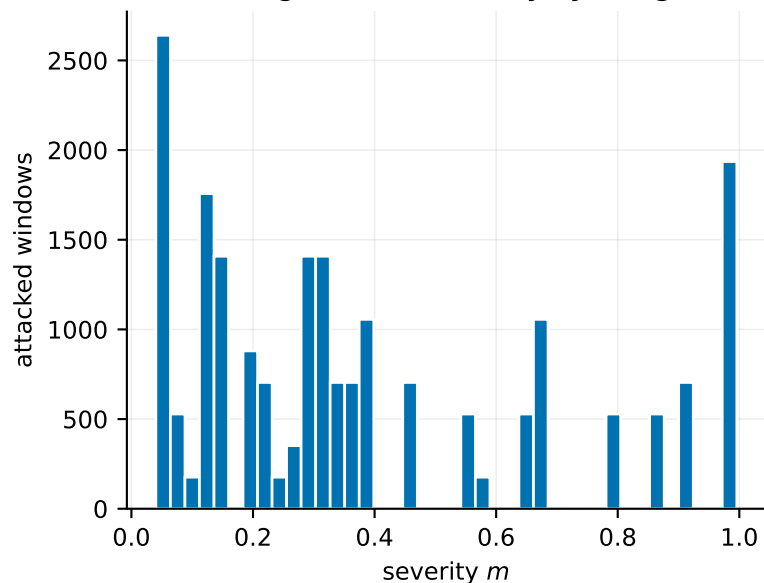

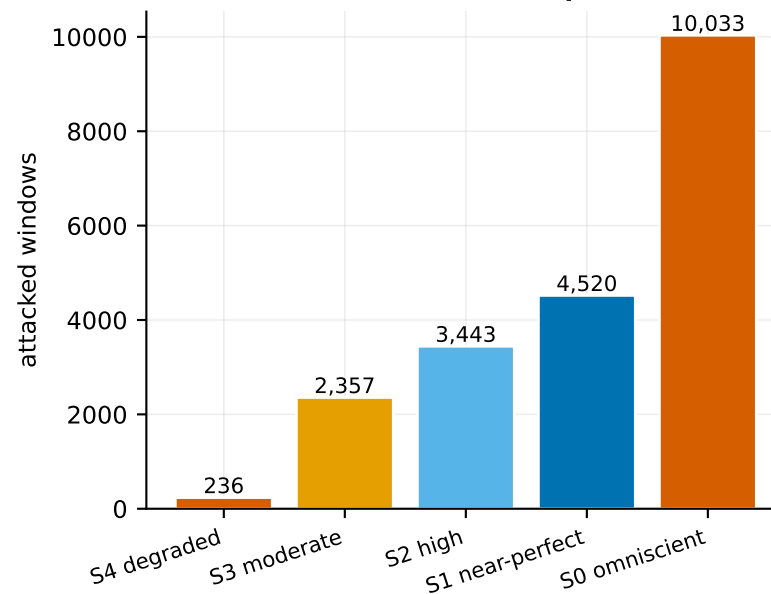

Figure 7 -- The SSC dataset.
Severity is drawn log-uniformly and the attacker's model error is varied, so the data spans stealth strata (a, b).
Every attacked window carries its attacker cost and state displacement (c, d), so results can be reported per stratum.

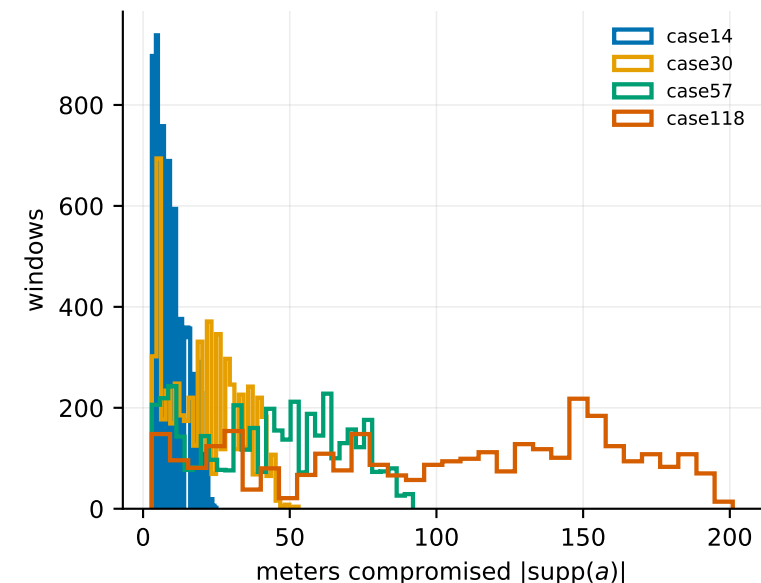

(a) log-uniform severity by design

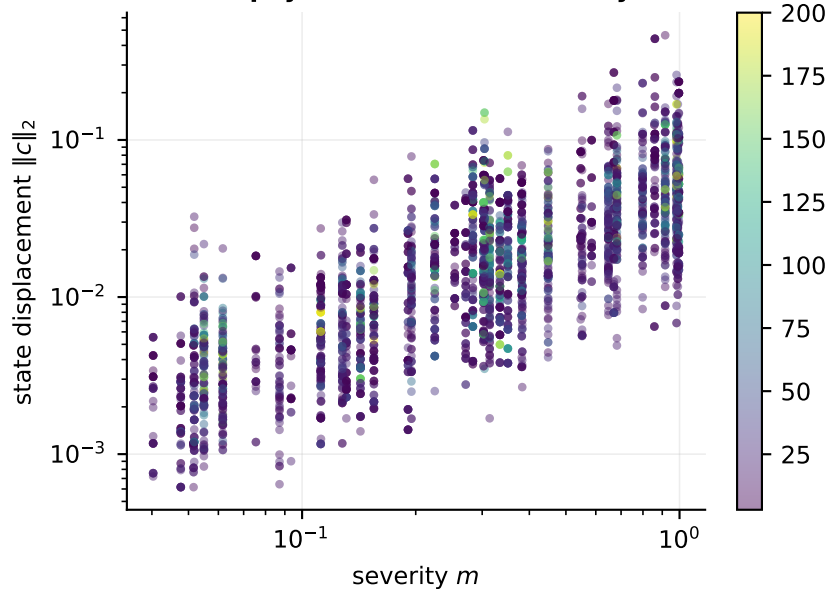

(b) stealth strata composition

(c) attacker cost across the dataset

(d) payoff scales with severity

(e) one episode: what the detector actually receives (red shading = attack active)
